

DATA BASE SYSTEMS Lab Task (1)

NAME:	Zulqarnain Mohi Ud Din
ROLL NO:	2024-SE-07
INSTRUCTOR:	Engr. Awais Rathor
SEMESTER:	4rth SEMESTER
DATE:	19-SEPT-2026

DEPARTMENT OF SOFTWARE ENGINEERING
UNIVERSITY OF AZAD JAMMU AND KASHMIR CHELLAH CAMPUS,
MUZAFFARABAD.

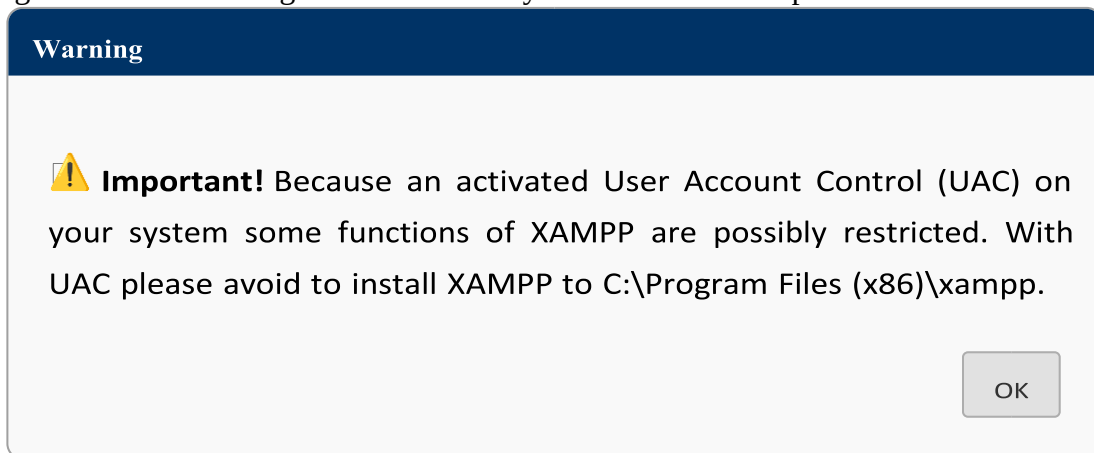

1. Step 1: Downloading the XAMPP Installer

Started by navigating to the official Apache Friends website. From the download section, I selected the XAMPP version for Windows. I opted for the version featuring the latest stable PHP release to ensure compatibility with modern scripts.

2. Step 2: Handling the UAC Warning

Once the download completed, I double-clicked the `.exe` file to start the installation. Before the setup wizard opened, I received a User Account Control (UAC) warning. I noted the warning about installing in the standard Program Files directory and clicked **OK** to proceed.

3. Step 3: Selecting Components

In the setup wizard, I was prompted to select the components for installation. Since our primary focus for the DBMS course is using MySQL along with a local server, I kept the default selections checked (including Apache, MySQL, and phpMyAdmin) and clicked **Next**.

The screenshot shows the 'Setup - XAMPP' window with a dark blue header. Below the header, the title 'Select Components' is followed by the instruction 'Check the components you want to install.' A list box contains four items, each with an unchecked checkbox: 'Apache', 'MySQL', 'PHP', and 'phpMyAdmin'. A 'Next >' button is located at the bottom right of the window.

4. Step 4: Choosing the Installation Directory

Next, I had to choose the installation folder. Following standard practice and the earlier UAC warning, I left the default path as . I `C:\xampp` then clicked **Next** to begin the unpacking and installation process.

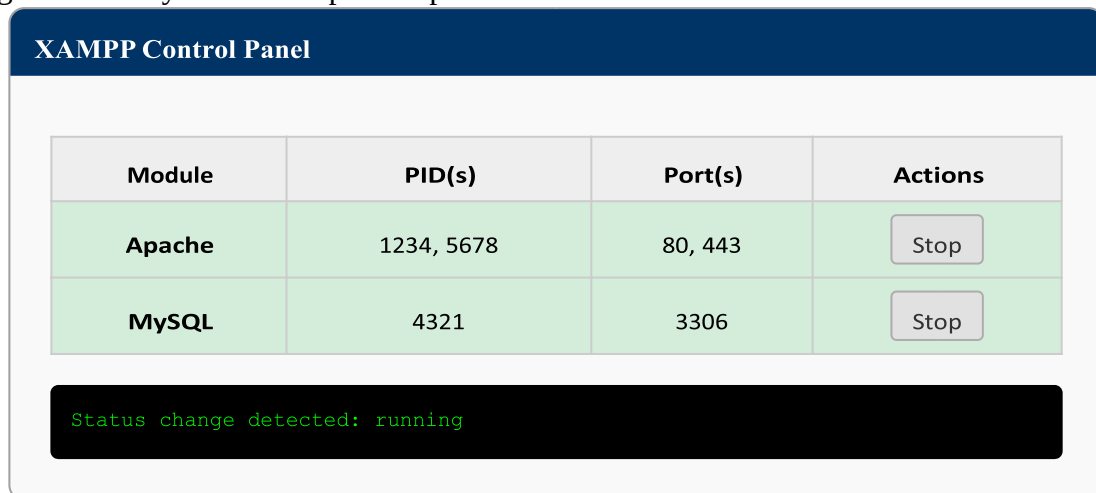

The screenshot shows the 'Setup - XAMPP' window with a dark blue header. Below the header, the title 'Installation folder' is followed by the instruction 'Please, choose a folder to install XAMPP'. A text box contains the path 'C:\xampp'. A 'Next >' button is located at the bottom right of the window.

5. Step 5: Windows Security Alert

During the installation, my Windows Defender Firewall prompted me to allow the Apache HTTP Server to communicate over my network. I ensured that "Private networks" was checked and clicked **Allow access** so that the local server would not be blocked.

6. Step 6: Launching the Control Panel

After the installation finished, I clicked **Finish**, ensuring the option to start the Control Panel was checked. Once the XAMPP Control Panel opened, I clicked the **Start** buttons next to both Apache and MySQL. I observed their background colors turn green, indicating that the services were running successfully on their respective ports.

7. Step 7: Verification

Finally, to verify my installation, I opened my web browser and typed . `http://localhost`

The XAMPP dashboard successfully loaded, confirming that the server and database environment is now ready for my DBMS assignments.
